acc?Is there any other software that can put my MIDI file in acc?May i use the software to convert wave to acc if the wave is with a software called boonsound.dll?ThanksMay i convert acc to wav?Do you have any other digital software that converts acc to mp3?Would be the best if i can convert acc to wav from a mac?May i convert acc to wav? MIDI Programming - The Basics by George E. Patkai  
In this article we will talk about MIDI Programming, a method of controlling various software instruments or devices via software. You will learn how to use MIDI Modules, and how to use a MIDI Controller with the device. We will also discuss the basics of MIDI Programming and how the programming flow works. This article assumes that you know very little about MIDI, which means that this is not the best place to start learning how to program MIDI. In fact, the programming language used to program MIDI is virtually impenetrable to newbies. It is better to use an application that can learn a MIDI file from a text file and do the programming for you. It is much easier to create a GUI from scratch that uses text file. Programming MIDI can take hours or days to learn. But in the end, if you understand the concepts of programming, you can create very complex applications. Open up a MIDI program such as SMF or Kontakt and load the file. We will start with the music file. How Do MIDI Controllers Work? The illustration below shows a simple MIDI controller. The controller does not contain any sound generating hardware, but sends note-on messages to a device every time the key is pressed. The controller can hold a lot of instruments, and the keyboard of the MIDI controller can be assigned to any instrument. In this example we have a MIDI controller (Kontakt) that is connected to a drum kit. There are 16 different pads on the controller and these pads represent 16 different instruments. We have a bank of 16 different drums that we assign the drum kit to. The function of the MIDI Keyword is a little more complicated. It is a software program that receives the MIDI messages and generates note-on messages in a consistent way. So for example, if we want to be able to play a snare drum, and the note number is 128, we first send the note on message 82157476af
